

REGIONAL SALES ANALYSIS

Sales Performance Dashboard

A Tableau-driven comparison of regional sales, orders, customers, and product performance

Project Overview

Why this dashboard was built

Sales performance analysis is central to strategic planning. As the analyst on this project, the goal was to build a Tableau dashboard that lets management compare two regions side by side — on demand — to spot trends and flag improvement areas.

Data source	Sample – Superstore dataset (Orders, 9,994 rows)
Tool	Tableau Desktop, single workbook
Audience	Upper management & regional teams
Output	One interactive, parameter-driven dashboard

SCENARIO

“As a data analyst, compare sales data from two regions and visualize it on a dashboard — highlighting regional trends and improvement areas — to support management’s decision-making and sales strategy.”

DELIVERABLE

A single dashboard that dynamically compares any two chosen regions across five KPIs.

How the Dashboard Was Built

Parameters and calculated fields drive dynamic region selection

01

Region Parameters

Two list parameters — Primary Region and Secondary Region — each populated with Central, East, South, West.

02

Calculated Filters

Primary Region Filter and Secondary Region Filter compare [Region] to each parameter to isolate the selected data.

03

KPI Worksheets

Five metrics × two regions = 10 worksheets: Total Sales, Avg Sales/Order, Total Orders, Unique Customers, Distinct Products.

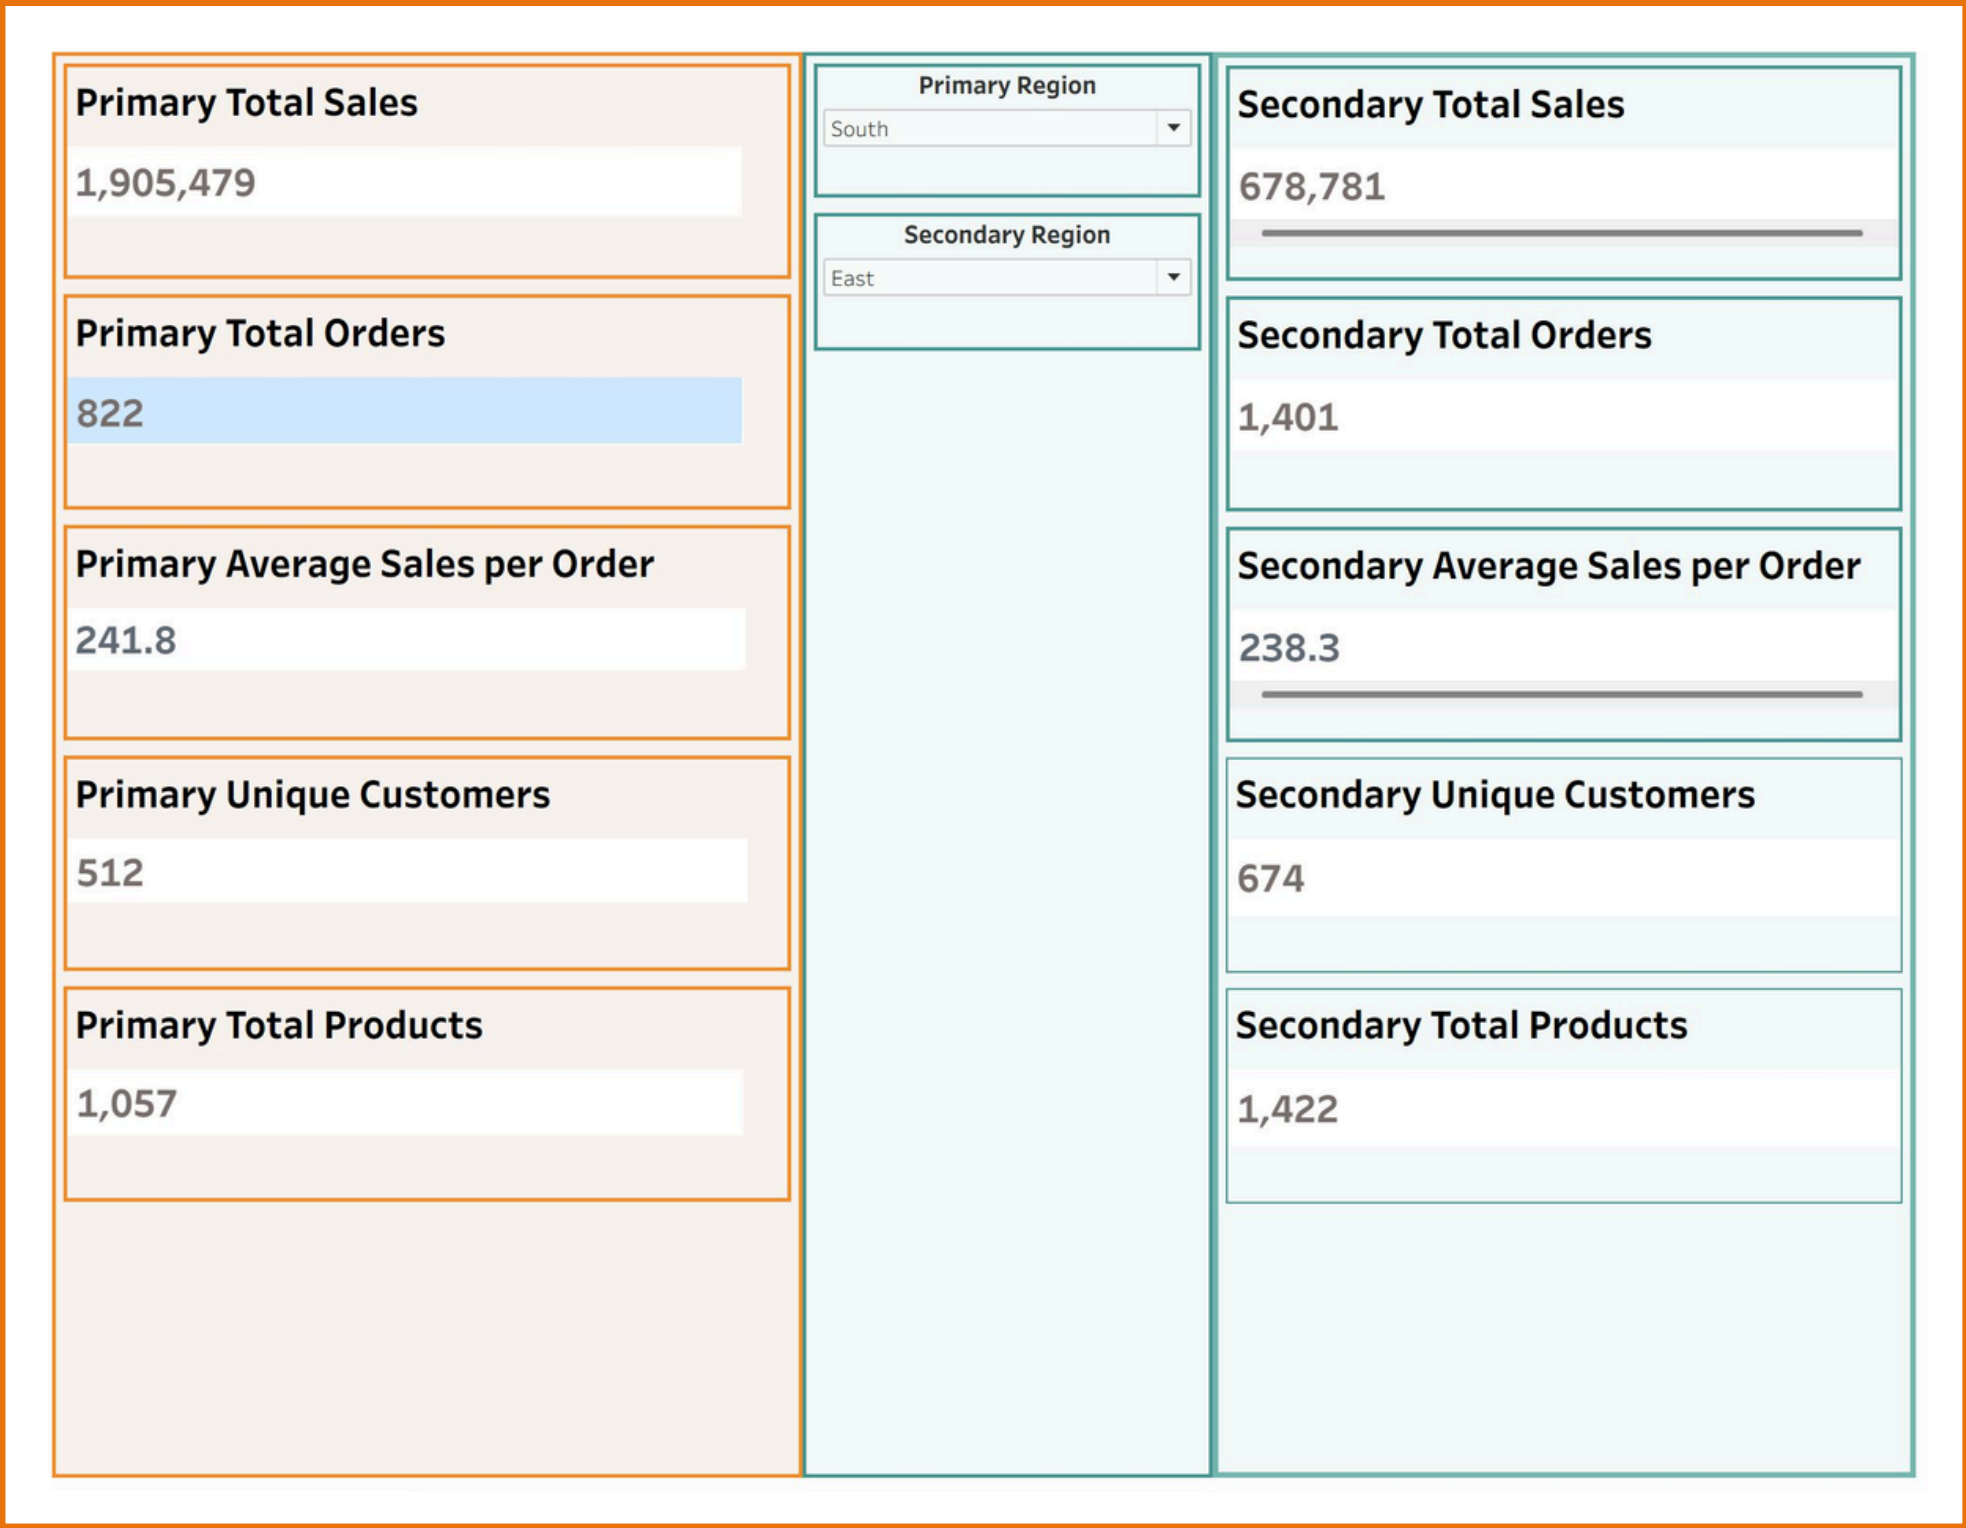

04

Unified Dashboard

All 10 worksheets combined into one dashboard using containers, split into Primary and Secondary sections with parameter controls.

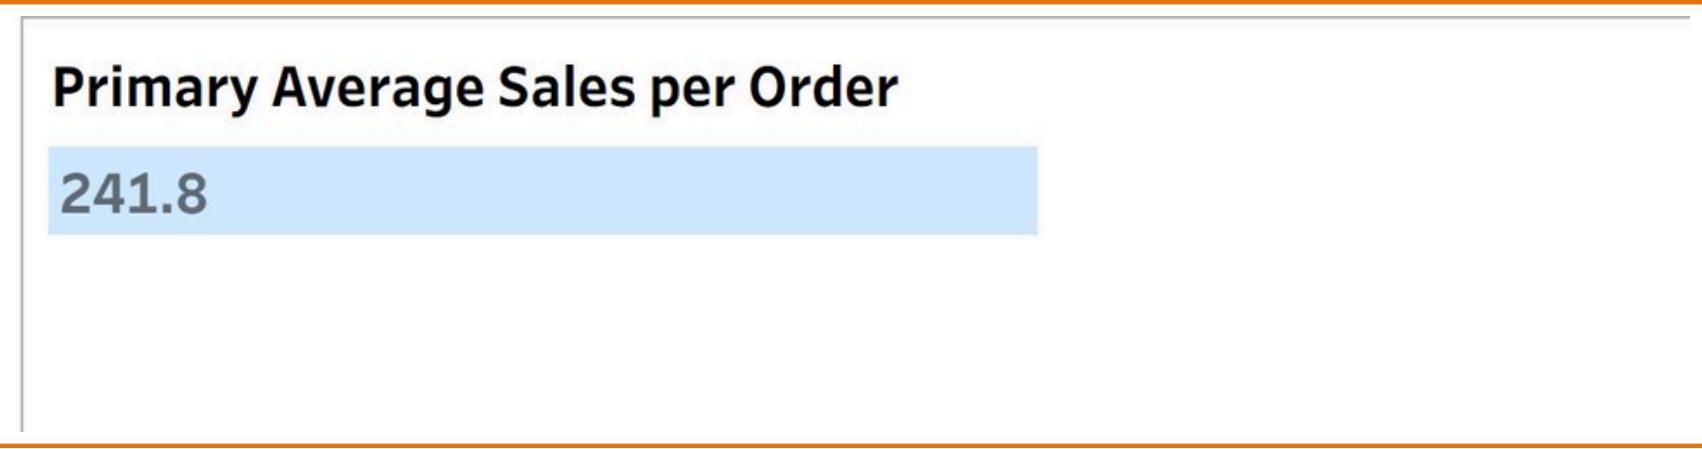

The Dashboard

Captured directly from Tableau — default view: Primary = South, Secondary = East

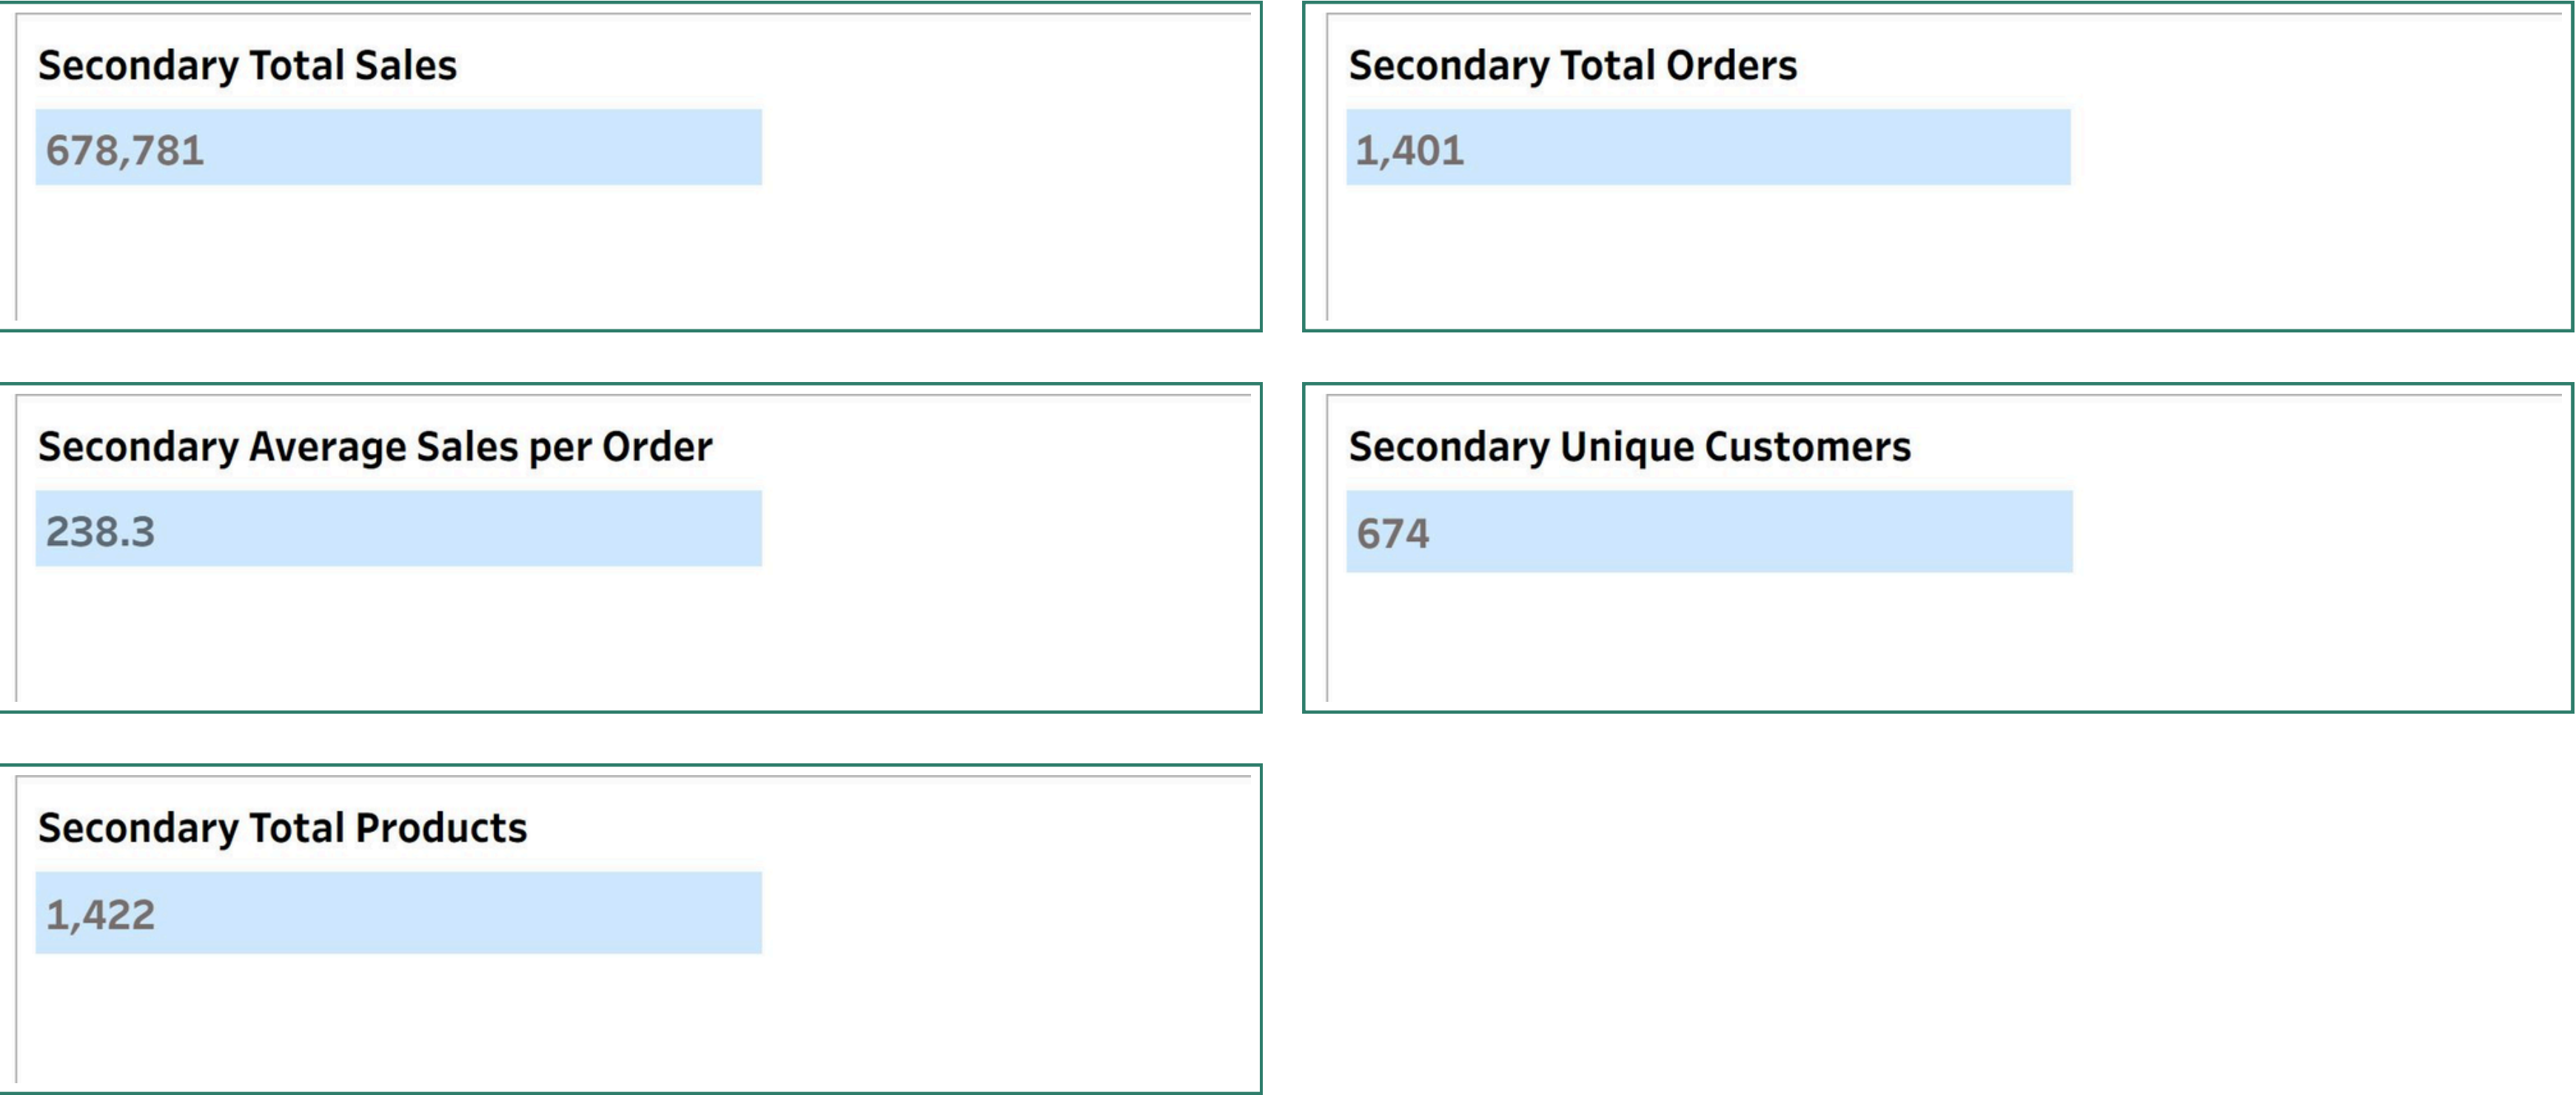

Worksheet Gallery — Primary Region

5 worksheets, each filtered by the Primary Region Filter calculated field

Worksheet Gallery — Secondary Region

5 worksheets, each filtered by the Secondary Region Filter calculated field

Regional Deep-Dive

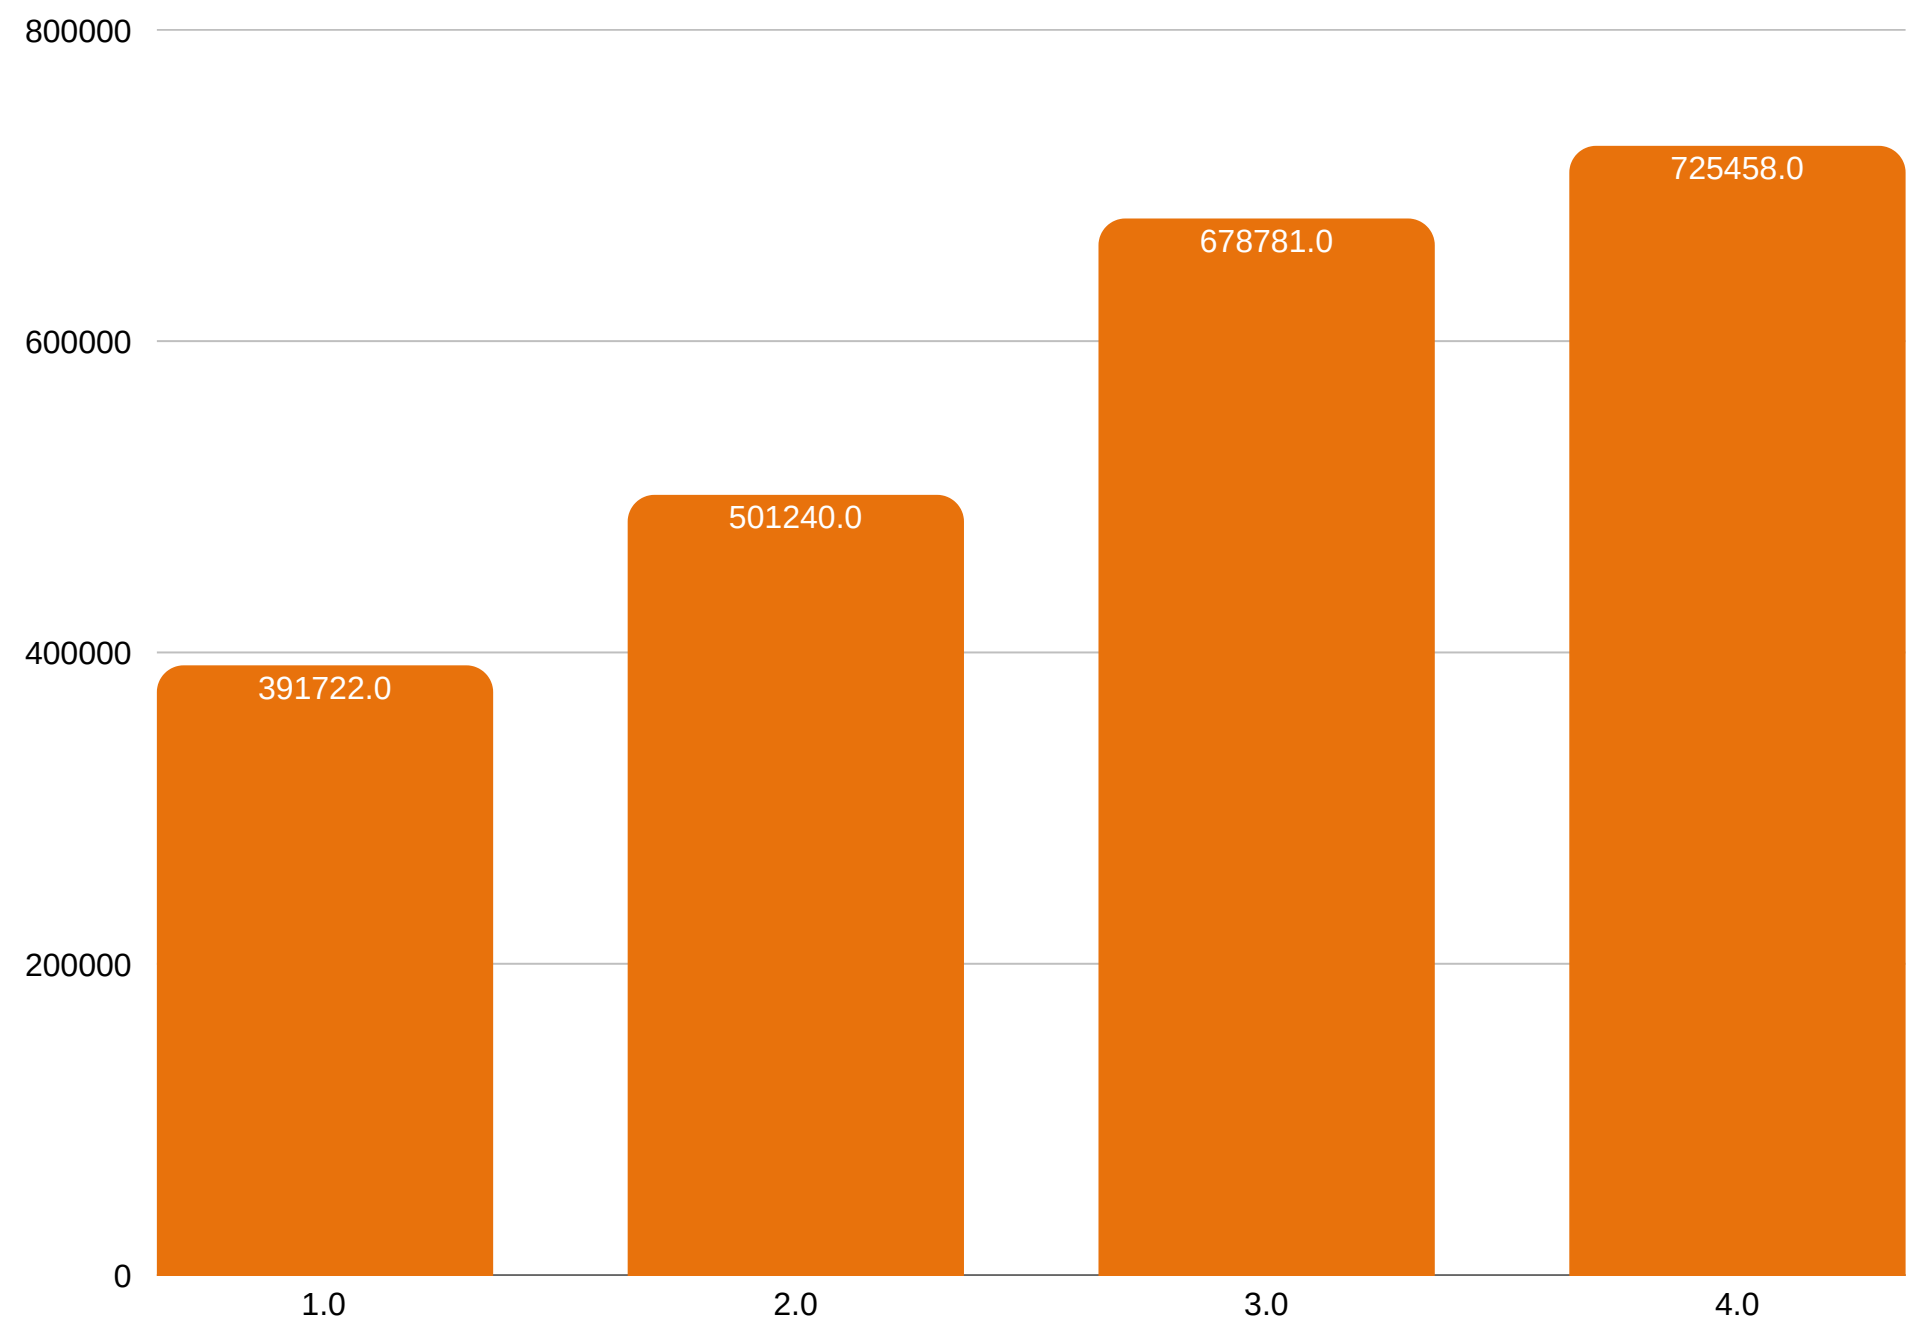

Dashboard default selection: Primary = South · Secondary = East

	SOUTH (Primary)	EAST (Secondary)
Total Sales	\$391,722	\$678,781
Avg Sales / Order	\$241.80	\$238.34
Total Orders	822	1,401
Unique Customers	512	674
Distinct Products	1,057	1,422

East outsells South by 73% in total revenue and leads on orders, customers, and assortment — while South holds a slightly higher average order value.

All-Region Benchmark

Total sales across all four regions in the Superstore dataset

Region	Sales	Orders	Customers
West	\$725,458	1,611	686
East	\$678,781	1,401	674
Central	\$501,240	1,175	629
South	\$391,722	822	512

West leads on volume; South is the smallest market on every metric.

Key Insights

What the dashboard reveals when regions are compared

1 West is the growth engine

Highest total sales (\$725K), most orders (1,611) and the widest product assortment (1,509 SKUs).

2 South is under-penetrated

Lowest sales, orders, and customer count of all four regions — despite the highest average order value.

3 Order value doesn't track volume

South's avg sales/order (\$241.80) edges out East (\$238.34) even though East sells 73% more overall.

4 Central lags on efficiency

Second in order count (1,175) but the lowest average order value (\$215.77) of all regions.

Recommendations

Turning the dashboard's findings into action

1

Prioritize customer acquisition campaigns in South to close the volume gap with East and West.

2

Study East and West's product assortment strategy and extend high-performing SKUs into Central and South.

3

Investigate Central's lower average order value — bundling or upsell tactics could lift ticket size.

4

Use the dashboard's parameter controls in monthly reviews to track any two regions against each other over time.
